

BARN CONVERSION
LINDAB BUILDING PRODUCTS LIMITED

Landscape design company Gardens Sorted specialises in renovation and bespoke garden installations. This project is a former farmyard and threshing barn conversion where the brief was to follow sustainable principles; indeed, the artefacts used around the garden are largely reclaimed, reused or recycled agricultural items.

The client gardens by organic principles and therefore the need for non-PVC galvanised rainwater goods was paramount. Chris Bligh, designer and installer at Gardens Sorted describes the installation:

”The rainwater solution required the high roof gutters to be deep profile, maintenance free, non-blocking outlets, and a long elegant downpipe into the storm water drain across the yard.

The addition of a rainwater diverter at the lower section afforded connection to a pressure water hose under grounded to two bends emptying into a reclaimed galvanised water tank. The hose is always full of water to the height of the tank. The important value of this is that the client can then dunk a large watering can into the deep water at waist height.”
