

## RETAIL REFURBISHMENT, THRINGSTONE

ARP LIMITED

Formerly a public house in the village of Thringstone in Leicestershire, the building's refurbishment as a retail outlet meant that providing a choice of products was the key element in the specification of metal rainwater goods for this particular project.

The specification required a metal gutter system that not only looked in keeping with the high street property but fitted the required budget. ARP's Sentinel 125mm x 100mm vintage ogee gutter was specified together with Colonnade 76mm diameter cast collared rainwater pipes proved to be ideal for the project.

Aluminium is an ideal choice material for the design and manufacture of low maintenance gutters and pipes. It has a high strength to weight ratio and is highly resistant to corrosion. It is a proven material in this application and provides a high level of design flexibility.

It can be precision manufactured and gives a high quality surface finish. It is available in a range of low maintenance finishes and unlike non-metal gutter materials is 100 per cent recyclable - a process which can save up to 95 per cent of the original energy input.
