

# Folded Aluminium Guttering

THE ROUNDHOUSE, CAMBRIDGESHIRE

Folded aluminium guttering is an incredibly flexible contemporary product which can be produced in almost any size and shape to meet the needs of the product. Typically supplied in polyester power coated finish with internal or joggle joints this product creates a smooth sleek fascia profile.

In this example a bespoke rainwater system was supplied for a unique new home in Cambridgeshire. Sarek - named after a fictional character in the Star Trek movies – has been dubbed 'the roundhouse' thanks to its spectacular circular structure which features an eyebrow framing the entrance.

Nestled in the heart of the countryside and built using a timber frame structure, the 12.3 metre diameter house required 40 lengths of 125 x 100mm aluminium box guttering - a popular choice for modern and contemporary homes.

Technical designers at the manufacturer worked with the architect to create the perfect guttering solution for this new build home. Using the architect's model, the team designed guttering which is curved both in plan and elevation around the eaves of the building, before dividing the pieces into metre-long lengths to form a true curve radius.

Sarek's guttering is polyester powder coated to RAL 9010 matt finish - a white colour.

Aluminium is a popular choice for curved guttering, providing a robust and versatile rainwater system, that is easy to fit and provides a long life.
