

# Steel Rainwater Systems

THE CUILLIN, SCOTLAND

Steel rainwater systems are very common on the continent, and are becoming more popular in the UK, with a distinctive rolled edge profile adding strength to the product. Strong, durable and very contemporary in appearance these gutters are also sometimes manufactured in other materials such as aluminium and copper.

In this example, the beauty of this new countryside home had to compete with that of the fabulous views overlooking the Ythan river, Bennachie and the Prop of Ythsie in the North East of Scotland.

The silver metallic coated galvanised guttering and downpipes were chosen to complement the exterior of the building which has Siberian larch cladding and seamless rendered

facades with varying height dry stone walls which come together around a 7m high gable window to create a stunning building.

Both developer and client were pleased with the products and will continue to use them on other projects, the manager of the contractor was quoted as saying, “they look fabulous, high quality, complementing the build” and more importantly the building owners were very happy with the end result, stating, “*The eye for detail and quality is excellent*”
